

# Hippocampus

## Territory & Description:

The hippocampus has the head and forelegs of a horse, but the tail of a dolphin. In the wild they travel in herds and graze on seaweed near the shore. They are particularly fond of lagoons and areas shielded from heavy surf. This makes the Phoenician islands an ideal place for them.

Phoenicians & Sea Elves use these animals extensively as beasts of burden, particularly as teams to tug ships in and out of dock. These animals are rarely used in the open ocean because they cannot survive storms. In the wild, however, hippocampi will often make epic journeys across well established routes. These creatures are most often found in salt water but survive in fresh water as well.

Hippocampi are mammals and need fresh air to survive. They can, however, hold their breath for over 15 minutes at a stretch and dive up to 800 feet.
